

1, Explain behaviour of hub device

⇒ Hub is a broadcast device, used to connect multiple device.
It is a layer 1 device.

⇒ When two device communicate at a time, it will collision.

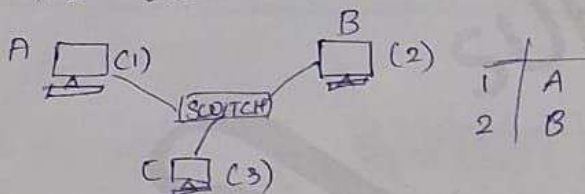

2, Explain behaviour of switch device

⇒ Switch is a broadcast device, it is layer 2 device.

⇒ It automatically build mac table for address learning.

⇒ If the assigned mac address found it will forward do Unicast, or

⇒ If mac not found it will do broadcast to find the destination mac.

3, Explain behaviour of router device

⇒ Router is used to break broadcast domain, it is layer 3

It will do only unicast.

⇒ It contains Routing table, it has three parameters.

* Network ID , * Prefix * Interface

⇒ It is used to connect different device.
